KalSoft in partnership with Microsoft and Windows Azure is providing extensive features and services to enable its customers to run solutions on one same cloud.

By providing access to built-in software patching, network load balancing and 24x7 technical support, KalSoft can enable its customers to enhance their business and save money to become agile.

### **Features**

With Windows Azure, Kalsoft can provide its customers with a variety of services including:

#### **1. Infrastructure Services**

Our customers will be enabled to provision Windows and Linux Virtual Machines and applications in minutes. Microsoft's hybrid consistency will enable them to use the same VMs and management tools in Azure that they use on-premises.

- Virtual Machines
- Storage, backup, and recovery
- Big Compute

#### **2. Develop Modern Applications**

KalSoft will enable its customers to build modern applications that take full advantage of the cloud. Azure will enable them to build and deploy a wide variety of applications – including web, mobile, media and line-of-business solutions. Built-in AutoScale features will also enable them to dynamically scale up and down to meet any needs.

- Web
- Mobile
- Media
- Integration
- Dev-Test

### 3. Insights from Data

Customers can trade up to get insights from any data, big or small. Azure provides managed SQL and NoSQL data services, and built-in support for analyzing and helping them gain insights from their data. We enable our customers to leverage the full power of SQL Server in the cloud as well as use HDInsight to build Hadoop clusters to analyze data.

- SQL Database
- HD Insight

### 4. Identity and Access Management

Windows Azure Active Directory is a comprehensive identity and access management cloud solution. Our customers can manage user accounts, synchronize with on-premises directories, get single sign on across Azure, Office 365 and hundreds of popular SaaS applications like Salesforce, Workday, Concur, DocuSign, Google Apps, Box, ServiceNow, Dropbox, and more.

- Active Directory
- Multi-Factor Authentication

## Services

### 1. Compute

#### [Virtual Machines](#)

Azure Virtual Machines will enable our customers to deploy a Windows Server or Linux image in the cloud. They can select images from a gallery or bring their own customized images.

#### [Cloud Services](#)

Azure Cloud Services remove the need to manage server infrastructure. With Web and Worker roles, they enable our customers to quickly build, deploy and manage modern applications.

## Websites

Azure Websites will enable our customers to deploy web applications on a scalable and reliable cloud infrastructure. They can quickly scale up and out or even scale automatically to meet their application needs.

## Mobile Services

Azure Mobile Services provides a scalable cloud backend for building Windows Store, Windows Phone, Apple iOS, Android, and HTML/JavaScript applications. Store data in the cloud, authenticate users, and send push notifications to your application within minutes.

### 2. Data Service

## Storage

Azure Storage offers non-relational data storage including Blob, Table, Queue and Drive storage.

## SQL Database

Azure SQL Database is a relational database service that enables our customers to rapidly create, extend, and scale relational applications into the cloud.

## Backup

Azure Backup manages cloud backups through familiar tools in Windows Server 2012, Windows Server 2012 Essentials, or System Center 2012 Data Protection Manager.

## Cache

Azure Cache is a distributed, in-memory, scalable solution that enables our customers to build highly scalable and responsive applications by providing super-fast access to data.

## HDInsight

Azure HDInsight Service is a Hadoop-based service that brings an Apache Hadoop solution to the cloud. It helps the customers gain full value of Big Data with a cloud-based data platform that manages data of any type and any size.

## Site Recovery

Site Recovery helps our customers protect important applications by coordinating the replication and recovery of private clouds for simple, cost-effective disaster recovery

## Machine Learning

Azure Machine Learning allows our customers to easily design, test, operationalize and manage predictive analytics solutions in the cloud.

### 3. App Services

## Media Services

Azure Media Services offer cloud-based media solutions from many existing technologies including ingest, encoding, format conversion, content protection and both on-demand and live streaming capabilities.

## Active Directory

Azure Active Directory (Azure AD) provides identity management and access control capabilities for cloud applications. Our customers can synchronize their on-premises identities and enable single sign-on to simplify user access to cloud applications. Azure AD is available in two tiers: Free and Premium. Azure Active Directory Premium is licensed separately from Azure Services.

## Multi-Factor Authentication

Azure Multi-Factor Authentication helps prevent unauthorized access to on-premises and cloud applications by providing an additional layer of authentication. Follow organizational security and compliance standards while also addressing user demand for convenient access.

## Service Bus

Azure Service Bus is a messaging infrastructure that sits between applications allowing them to exchange messages for improved scale and resiliency

## Notification Hubs

Notification Hubs provide a highly scalable, cross-platform push notification infrastructure that enables our customers to either broadcast push notifications to millions of users at once or tailor notifications to individual users.

## BizTalk Services

Azure BizTalk Services is a powerful and extensible cloud-based integration service that provides Business-to-Business (B2B) and Enterprise Application Integration (EAI) capabilities for delivering cloud and hybrid integration solutions.

## Scheduler

Azure Scheduler allows you to invoke actions that call HTTP/S endpoints or post messages to a storage queue on any schedule. In Scheduler, our customers can create jobs that reliably call services either inside or outside of Azure and run those jobs right away, on a regular or irregular schedule, or set them to run at a future date.

## Visual Studio Online

Visual Studio Online provides a cloud-based ALM solution that handles everything from hosted code repos and issue tracking to load testing and automated builds. Best of all, it's accessible from nearly

anywhere, and our customers can create an account for free. Visual Studio Online is licensed separately from Azure Services.

## Automation

Azure Automation allows our customers to automate the creation, deployment, monitoring, and maintenance of resources in their Azure environment using a highly scalable and reliable workflow execution engine.

## CDN

Azure CDN (Content Delivery Network) allows our customers to deliver high-bandwidth content to end-users around the world with low latency and high availability via a robust network of global data centers.

## Azure RemoteApp

Azure RemoteApp helps employees stay productive anywhere, on a variety of devices - Windows, Mac OS X, iOS, or Android.

## API Management

Azure API Management allows our customers to publish APIs to developers, partners and employees securely and at scale.

## Event Hubs

Azure Event Hubs enables elastic scale telemetry and event ingestion with durable buffering and sub-second end to end latency for millions of devices and events.

#### 4. Network

## ExpressRoute

Azure ExpressRoute enables our customers to create private connections between Azure datacenters and infrastructure that's on their premises or in a colocation environment.

## Virtual Network

Azure Virtual Network enables our customers to create Virtual Private Networks (VPN) within Azure and securely link these with on-premises IT infrastructure.

## Traffic Manager

Azure Traffic Manager allows our customers to load balance incoming traffic across multiple hosted Azure services whether they're running in the same datacenter or across different datacenters around the world.
